Nuclear physics is the field of physics that studies atomic nuclei and their constituents and interactions, in addition to the study of other forms of nuclear matter. Nuclear physics should not be confused with atomic physics, which studies the atom as a whole, including its electrons. Discoveries in nuclear physics have led to applications in many fields.

Hermann von Helmholtz (1821–1894) participated in two of the most significant developments in physics and in the philosophy of science in the 19th century: the proof that Euclidean geometry does not describe the only possible visualizable and physical space, and the shift from physics based on actions between particles at a distance to the field theory.

Laws of nature "drive" the world. The laws of physics which, for example, describe the behavior of diffraction gratings (see Harrison) were true from time immemorial and it is because of those laws that diffraction gratings, when they came to be engineered in modern times, have the peculiar properties they do.

The Common Cause Principle was introduced by Hans Reichenbach, in The Direction of Time, which was published posthumously in 1956. Suppose that two events A and B are positively correlated: $\lvert p(A\text{cap } B) > p(A)p(B) \rvert$. Suppose, moreover, that neither event is a cause of the other. Then, Reichenbach's Common Cause Principle (RCCP) states that A and B will have a common cause that renders them ...
