A turbocharger, colloquially known as a turbo, is a turbine-driven, forced induction device that increases an internal combustion engine's efficiency and power output by forcing extra compressed air into the combustion chamber. This improvement over a naturally aspirated engine's power output is because the compressor can force more air—and proportionately more fuel—into the combustion ...

The Boost Timing Masters allow you to adjust the amount of ignition retard from 1° per pound of boost to 3° per pound via a control knob that you mount on the dashboard. This way you can make adjustments on the fly to prevent detonation as fuel quality or altitude and air quality changes up to a maximum of 15° retard. You can also set a boost pressure point to start the retard. There is a ...

Coil-on-Plug Ignition System. The coil-on-plug (COP) vehicle ignition system incorporates all the electronic controls found in a DIS car ignition system, but instead of two cylinders sharing a single coil, each COP coil services just one cylinder, and has twice as much time to develop maximum magnetic field. As a result, some COP car ignition systems generate as much as 40,000 to 50,000 volts ...

Three Types of Vehicle Ignition Systems and How They Work

An ignition system generates a spark or heats an electrode to a high temperature to ignite a fuel-air mixture in spark ignition internal combustion engines, oil-fired and gas-fired boilers, rocket engines, etc. The widest application for spark ignition internal combustion engines is in petrol (gasoline) road vehicles such as cars and motorcycles.

Ignition system - Wikipedia

In the primary ignition coil, current is built up to produce a magnetic field. When the field is at its fullest level, a contact breaker opens to allow stored energy to transfer to a secondary coil. The current becomes amplified from 12V to 20,000V so that the spark plugs can be fired up. Purchase your ignition coils for Saab 9-3 online and ...
