Programming languages are one of the most important and direct tools for the construction of a computer system: in a modern computer different languages are routinely used for different levels of abstraction. Programming language is important because it defines the relationship, semantics and grammar which allows the programmers to effectively communicate with the machines that they program.

The Elements of Programming Functional Programming is a paradigm of programming that is most similar to evaluation of expressions in mathematics. In functional programming a program is viewed as an expression, which is evaluated by successive application of functions to their arguments, and substitution of the result for the functional expression. Its origin is in the lambda calculus of Church.

This course is a study of the deeper principles behind programming language designs, and not of particular programming languages. We focus on fundamental language features such as data structures, functions, objects, types and concurrency, and how they interact with each other to achieve the desired expressiveness. We study features through the implementation of interpreters and through operational semantics and type systems,

Programming languages play a central role in computer science. All programs are written in a language, and it is obvious that some are better than others, at least for some purposes. The constant demand for new languages reflects the changing demands for constructing reliable and maintainable software systems.
